Hyderabad, Telangana, India

PROFESSIONAL SUMMARY

CS graduate (MVSR Engineering College, CGPA 8.82/10) with two ML internships on AWS and GCP and two AWS certifications. Built DynamicBI, a multi-agent BI platform (FastAPI, LangGraph, React), and a multimodal RAG document Q&A tool. Comfortable across PyTorch, TensorFlow, LangChain, and cloud ML deployment.

EDUCATION

Bachelor of Engineering in Computer Science Engineering

2022 – 2026

Maturi Venkata Subba Rao Engineering College, Hyderabad, Telangana CGPA: 8.82/10 | Specialization: IoT, Cyber Security & Blockchain

INTERNSHIP EXPERIENCE

AI/ML Virtual Intern

Apr 2025 – Jun 2025

Google Cloud Platform — via MVSR Engineering College

- Trained and tuned regression, classification, and deep learning models in TensorFlow on GCP.
- Built an image-recognition pipeline with CNNs, data augmentation, and transfer learning.
- Ran the full workflow: dataset prep, feature engineering, cross-validation, and evaluation.

AI/ML Virtual Intern

Apr 2024 – Jun 2024

Amazon Web Services (AWS) — via MVSR Engineering College

- Trained and deployed ML models on Amazon SageMaker, served as REST API endpoints.
- Used S3 for data storage and CloudWatch/SageMaker Clarify for monitoring, drift detection, and bias analysis.
- Covered the AWS ML workflow end to end: ingestion, EDA, training, evaluation, and deployment.

TECHNICAL SKILLS

Programming Languages: Python, Java, C/C++, JavaScript

AI / Machine Learning: PyTorch, TensorFlow, Scikit-learn, Hugging Face Transformers, CNN, RNN, LSTM, NLP, Transfer Learning, Model Fine-Tuning

Generative AI & LLMs: LangChain, LangGraph, CrewAI, Prompt Engineering, RAG, FAISS, ChromaDB, Google Gemini, NVIDIA NIM, Multi-Agent Systems

Cloud Platforms: AWS, Google Cloud Platform, Microsoft Azure

MLOps & DevOps: Docker, Git, GitHub, CI/CD, Model Versioning, Experiment Tracking, Bias Detection

Data Science & Analytics: Pandas, NumPy, Matplotlib, Seaborn, Statsmodels, Anomaly Detection, Time-Series Forecasting, EDA

Web & API Development: FastAPI, Flask, React (Vite), Node.js, Streamlit, REST APIs, HTML, CSS

Blockchain & Web3: Solidity, Web3.js, Ethereum, MetaMask, Smart Contracts

Databases: PostgreSQL, MySQL, SQL, MongoDB, ChromaDB, FAISS

Developer Tools: VS Code, Jupyter Notebook, Postman, Linux

PROJECTS

DynamicBI: AI-Powered Business Intelligence Platform

dynamicbi.akshithsai.co.in

Tech Stack: Python, FastAPI, LangGraph, React (Vite), NVIDIA NIM, Statsmodels, Scikit-learn, Pandas, NumPy

- Built a 10-agent LangGraph pipeline that loads, cleans, and profiles a dataset, then computes KPIs, detects anomalies, forecasts trends, and writes an AI-generated dashboard layout.
- Connects to CSV, Excel, PostgreSQL, MySQL, SQLite, and MongoDB, with automatic source detection and schema inspection for each.
- Used Isolation Forest for anomaly detection, paired with interactive scatter panels and an AI-written explanation of each flagged outlier.
- Added time-series forecasting with confidence bands, click-to-drill-down on any chart segment, and a chat tab where users query the dataset in plain English.
- Gave every browser tab its own isolated session, with uploaded files auto-deleted on tab close or after 90 seconds of inactivity, so concurrent users never collide.
- Built full dashboard export/import as JSON, so a finished dashboard (KPIs, charts, forecasts, anomalies, insights) can be reopened offline.

MultiModal RAG: Document Q&A Engine

rag.akshithsai.co.in

Tech Stack: Python, FastAPI, LangChain, ChromaDB, React (Vite), NVIDIA NIM, OpenRouter

- Built a RAG app that answers questions over PDFs, DOCX, PPTX, CSV, images, web pages, and YouTube transcripts through one chat interface.
- Wrote file-type-specific loaders for text, tables, and images; embedded content with NVIDIA's llama-nemotron-embed-1b-v2 and indexed it in ChromaDB.
- Used NVIDIA's Llama 4 Maverick vision model so the app can also read and answer questions about images and slides, not just text.
- Added top-K retrieval with citations — each answer shows the source chunk, page number, and similarity score.
- Shipped a zero-config React (Vite) frontend where users can drop in their own API key at runtime instead of hardcoding one.

Handwritten Digit Recognition: CNN on MNIST

Tech Stack: Python, PyTorch, Flask, NumPy, Matplotlib

- Trained a CNN from scratch in PyTorch on MNIST, using batch norm, dropout, and Adam to control overfitting.
- Checked results with confusion matrices, precision/recall, and learning curves, then tuned depth and hyperparameters across several runs.
- Visualized learned convolutional filters and activation maps to see what the network was actually picking up on.
- Deployed the model behind a Flask API for real-time predictions with confidence scores.

Decentralized Banking DApp: Blockchain Transactions

Tech Stack: Solidity, Web3.js, Node.js, MetaMask, Ethereum

- Built an Ethereum DApp for on-chain deposits and withdrawals via smart contracts.
- Wrote gas-optimized Solidity contracts for transaction logic, balance tracking, and access control.
- Connected the frontend to Ethereum with Web3.js and Node.js for live contract reads and writes.
- Integrated MetaMask for wallet login and transaction signing, so no separate account system was needed.

CERTIFICATIONS

- **AWS Certified Machine Learning Engineer – Associate**
- **AWS Certified AI Practitioner**
- **Data Science and Machine Learning**
- **Multi AI Agent Systems with CrewAI**
